

Lab Notebook Entry 1

Project:

1

Tutorial (title or week #):

Week #1

Name:

Taylor Paydos

Date:

9/7

Notes:

- It took me a little while to figure out exactly what docker does, still a bit confused about it but it works as a container for different softwares?? Allowing easier communication between them I think
- Learned some new stuff about terminal, it took me a full year to understand how to use github + push + actually be like ahhhhh i understand what I'm doing so it was nice to have a refresher on terminal I forgot you can just drag folders in instead of manually finding them
- First time using python! Definitely similar to javascript so it feels like the learning curve won't be too much, code for this tutorial feels pretty understandable + basic
- The command lines to push were insane and I had to stop and put them in like 7 different times because I kept typing them wrong
- Overall this tutorial was easy to follow, I still don't totally understand dockers role in all of this-- are there ways to push w out using it? Does it help it to run better? I'm not sure
